LISTING OF THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

1. (Previously presented) Method for manufacturing ceramic parts with a certain porosity by sintering using microwaves, the materials to be sintered being arranged in a vessel, said method comprising:

introducing, via said microwaves, sintering energy into the materials to be sintered via electromagnetic waves in the range of vacuum wavelengths between 5 cm – 20 cm in multimode having an electromagnetic power of up to one kilowatt, wherein, besides being built from primary materials for the structure of the vessel, the vessel is built from a secondary material which comprises at least one material selected from the group consisting of: non-metallic materials, para-magnetic materials, ferro-magnetic materials and antiferromagnetic materials.

- 2. (Previously presented) Method of claim 1, wherein said wavelength range of the electromagnetic waves is between 11-13 cm.
- 3. (Previously presented) Method of claim 1, wherein said ceramic parts have a porosity of between 0-50 percent by volume.
- 4. (Previously presented) Method of claim 3, wherein said porosity is between 10 30 % by volume, the porosity being controllable through the temperature pattern.
- 5. (Previously presented) Method of claim 1, wherein said ceramic parts are infiltrated with a glass material to produce the final strength.
- 6. (Previously presented) Method of claim 1, wherein said ceramic parts are sintered to a defined final density of at least 80% of the theoretical density of the respective material.

- 7. (Previously presented) Method of claim 1, wherein said ceramic parts are dental restorations.
- 8. (Previously presented) Method of claim 7, wherein said dental restorations are veneered using a glass material.
- 9. (Previously presented) Method of claim 1, wherein said material is selected from the group consisting of: Al₂O₃, Spinell, Ce- or Y-stabilized ZrO₂, and mixtures thereof.
- 10. (Previously presented) Method of manufacturing full ceramic dental restorations from dental ceramic masses with a certain porosity by sintering using microwaves, said ceramic masses that are to be sintered being arranged in a vessel, said method comprising:

introducing, via said microwaves, sintering energy into said ceramic masses to be sintered via electromagnetic waves in the range of vacuum wavelengths between 5 cm – 20 cm in multimode having an electromagnetic power of up to one kilowatt, wherein, besides being built from primary materials for the structure of the vessel, the vessel is built from a secondary material which comprises at least one material selected from the group consisting of: non-metallic materials, para-magnetic materials, ferromagnetic materials and antiferromagnetic materials.

11-21. (Cancelled)
